

ABSTRACT OF THE DISCLOSURE

A composition to be used as a topical treatment for carpet and textiles, and a process for producing the composition are provided. The composition has desirable antibacterial, antimicrobial, and antifungal properties, and is made up of an effective amount of an antimicrobial agent having a blend of substituted ammonium salts of alkylated phosphoric acids admixed with free alkylated phosphoric acid, an effective amount of a pesticide containing Permethrin, a sufficient amount of an emulsifier in the form of an ammonium nonylphenol ether sulfate, and, optionally, an effective amount of a fragrance additive, all mixed with water. The process involves premixing with water the emulsifier, the antimicrobial agent, and, where used, the fragrance additive, adding this premix to a larger quantity of water, agitating the composition, slowly adding the pesticide while agitating, and continuing the agitation for a predetermined period of time.
